

AI Usage Log - Sprint 1

Project Title: Career Connect - Job Search and Application Tracking Platform

TEMPLATE:

Team Member Name: [Insert Name]

Instructions: Every use of AI must be documented using the format below. At the end of the sprint, export this document as a PDF and upload it to your personal subdirectory within the AI_Log folder.

- **Task ID/Title:** [Insert task description]
- **Purpose of AI Use:** [Insert purpose]
- **Chat Link or Prompt/Response:** [Insert link or note appendix reference]
- **AI-Suggested Content:** [Insert summary]
- **Validation:** [Insert validation method]
- **Decision:** [Accepted / Modified before use / Rejected]
- **Reflection:** [Insert reflection]
- **Responsible Person:** [Your Name]

JULIA

Entry 1 (09/24/2026)

Task ID/Title: Task: Create AI Usage Log Documentation Template

Purpose of AI Use: Documentation writing and editing

Chat Link or Prompt/Response:

- **Prompt 1:** "Create the text based template for a word document for the AI usage log"
- **Prompt 2:** "create a .docx document containing that and send it to me."
- **Response:** Provided a structured Markdown template incorporating all required fields and a Python script attempt for a .docx file.

AI-Suggested Content: A formatted template structured with Part 1 for AI interaction logs and Part 2 for clearly separated, original team-generated user stories and features.

Validation: Manual review and comparison against the "AI Usage Log Requirements" and "Required Log Entry Format" detailed in the Sprint 1 project instructions.

Decision: Accepted

Reflection: Generating the template with AI ensured that all strictly mandated fields were included without missing any structural requirements from the grading rubric, saving time during the repository setup phase.

Responsible Person: Julia Kyrychuk

Michel Yosufov

Task ID/Title: Implement Profile Management + Resume Upload backend (initial prototype)

Purpose of AI Use: Prototype the Sprint 1 "Resume Upload and Profile Management" feature

Chat Link or Prompt/Response: https://claude.ai/code/session_019obdut6J7ggJhg2X6z7mRR

AI-Suggested Content: Generated a Spring Boot ProfileController, UserProfile entity, UserProfileRepository, and a Thymeleaf profile.html template implementing profile editing and resume upload/download endpoints.

Validation: Read through the generated code and ran the app locally.

Decision: Rejected

Reflection: Built before the team's tech stack was confirmed. The team's actual stack is React/Node.js/MongoDB, not Java/Spring Boot, so this implementation was superseded and not used in the final submission. Lesson: confirm the team's stack decision before starting implementation.

Responsible Person: Michel Yosufov

Task ID/Title: Review self-written Login.jsx component

Purpose of AI Use: Sprint 1 "User Registration/Authentication" feature — frontend login form

Chat Link or Prompt/Response: https://claude.ai/code/session_019obdut6J7ggJhg2X6z7mRR

AI-Suggested Content: Identified that the label elements were not linked to their input fields (missing htmlFor/id pairing) and suggested the fix.

Validation: Applied the suggested fix and manually tested that clicking each label focuses the corresponding input.

Decision: Modified before use

Reflection: Accepted the accessibility fix (htmlFor/id); the rest of the component (state, form structure, submit handler) was my own and left unchanged.

Responsible Person: Michel Yosufov

Task ID/Title: Review self-written Profile.jsx component

Purpose of AI Use: Sprint 1 "Resume Upload and Profile Management" feature — frontend profile form

Chat Link or Prompt/Response: https://claude.ai/code/session_019obdut6J7ggJhg2X6z7mRR

AI-Suggested Content: Same htmlFor/id accessibility fix as Login.jsx; also flagged that combining "Create Account" and "My Profile" in one component/heading may need to be split into two separate components later.

Validation: Applied the label fix and tested manually; the component-split suggestion was noted but not acted on.

Decision: Modified before use

Reflection: Accepted the label fix. Deferred the create-account/profile split pending a team discussion, since it affects how the signup flow is structured.

Responsible Person: Michel Yosufov

Task ID/Title: Set up client-side routing in App.jsx

Purpose of AI Use: Make the Login and Profile pages reachable/navigable in the browser for the Sprint 1 demo

Chat Link or Prompt/Response: https://claude.ai/code/session_019obdut6J7ggJhg2X6z7mRR

AI-Suggested Content: Provided a react-router-dom-based App.jsx using BrowserRouter/Routes, mapping /login, /create-account, /profile, and / to the existing Login and Profile components.

Validation: Ran the app with "npm run dev" and manually navigated to each route in the browser to confirm the correct component rendered.

Decision: Accepted

Reflection: Used as provided with no changes; straightforward boilerplate for wiring existing components into routes.

Responsible Person: Michel Yosufov

Task ID/Title: Clarify README vs. Team Process document content

Purpose of AI Use: Meet the Sprint 1 documentation deliverables (README + team process doc)

Chat Link or Prompt/Response: https://claude.ai/code/session_019obdut6J7ggJhg2X6z7mRR

AI-Suggested Content: Outlined what belongs in each document per the assignment rubric: README covers project description, team, tech stack, setup, and features; the team process doc covers workflow, branching convention, PR process, code review expectations, and Definition of Ready/Done.

Validation: Cross-checked the breakdown against the Sprint 1 assignment instructions and rubric.

Decision: Accepted

Reflection: Used this structure to organize the two documents and avoid duplicating content between them.

Responsible Person: Michel Yosufov

Task ID/Title: Set up Node.js/Express backend project (server.js, config/db.js, MongoDB Atlas connection)

Purpose of AI Use: Sprint 1 backend skeleton needed to support the Registration/Authentication and Profile/Resume features

Chat Link or Prompt/Response: https://claude.ai/code/session_019obdut6J7ggJhg2X6z7mRR

AI-Suggested Content: Provided step-by-step guidance to scaffold the server folder, install dependencies (express, mongoose, dotenv, cors, bcryptjs, jsonwebtoken, multer), create an Express entry point with a health-check route, and connect to a MongoDB Atlas cluster via a config/db.js module.

Validation: Ran the server locally with "npm run dev", debugged a folder-location mistake, a missing scripts entry in package.json, a mismatched .env variable name, and a MongoDB Atlas authentication error, then confirmed a successful "MongoDB connected" message and a working /api/health response in the browser.

Decision: Accepted

Reflection: Followed the guidance step by step and typed the code myself rather than pasting a finished server; needed multiple rounds of debugging (env var casing, missing file, Atlas password mismatch) before it worked, which helped me understand the moving pieces rather than just copying a working result.

Responsible Person: Michel Yosufov

Task ID/Title: Build User model with password hashing (models/User.js)

Purpose of AI Use: Define the user data schema (job seeker / recruiter) needed for registration and login

Chat Link or Prompt/Response: https://claude.ai/code/session_019obdut6J7ggJhg2X6z7mRR

AI-Suggested Content: Provided a Mongoose schema for User (fullName, email, password, role, headline, resumeFileName) with a pre-save hook that hashes the password using bcryptjs, and a comparePassword instance method for login checks.

Validation: Used it directly in the auth routes; hit a runtime error ("next is not a function") caused by an outdated next-callback pattern that didn't match the installed Mongoose version, fixed by switching the pre-save hook to a plain async function with no next parameter, then confirmed in

MongoDB Atlas's Data Explorer that a created user's password field was stored as a hash, not plain text.

Decision: Modified before use

Reflection: Accepted the schema and hashing approach but had to correct the pre-save hook signature for compatibility with the installed Mongoose version. Good reminder that AI-suggested code can rely on APIs that differ between library versions and needs to actually be run, not just read, before trusting it.

Responsible Person: Michel Yosufov

Task ID/Title: Build register/login auth routes (routes/authRoutes.js)

Purpose of AI Use: Sprint 1 "User Registration and Authentication" feature — backend API

Chat Link or Prompt/Response: https://claude.ai/code/session_019obdut6J7ggJhg2X6z7mRR

AI-Suggested Content: Provided POST /api/auth/register and POST /api/auth/login route handlers: register checks for an existing email, creates the user (password hashed via the model), and returns a signed JWT; login looks up the user, compares the password, and returns a JWT on success, using an identical generic error message for a wrong email or password.

Validation: Wired the routes into server.js, tested both endpoints manually with PowerShell's Invoke-RestMethod (register a new user, attempt login with the same credentials), and confirmed both returned valid JWT tokens and the expected user fields.

Decision: Accepted

Reflection: Used as provided. Manually testing each endpoint with real requests (rather than just reading the code) is what caught the pre-save hook bug above, so I plan to keep testing every new route this way.

Responsible Person: Michel Yosufov

Task ID/Title: Connect Login.jsx to the real /api/auth/login endpoint

Purpose of AI Use: Make the Sprint 1 "User Registration and Authentication" feature demoable end-to-end in the browser

Chat Link or Prompt/Response: https://claude.ai/code/session_019obdut6J7ggJhg2X6z7mRR

AI-Suggested Content: Replaced the placeholder alert in Login.jsx's onSubmit with a real fetch call to the backend, storing the returned JWT in localStorage on success and showing the logged-in user's name. **Validation:** Tested in the browser with dev tools (Console and Network tabs) after the request initially failed silently; found and fixed a typo ("passowrd" instead of "password" in the request body) and a template-literal bug (single quotes instead of backticks) that were breaking the

request before it ever reached the server. Confirmed a successful login shows the real username, and an incorrect password shows a proper error instead of crashing.

Decision: Modified before use

Reflection: The AI-provided fetch code was correct; the bugs were introduced while typing it in myself. The debugging process was the actual learning here, and I added a `console.error(err)` afterward so a similar mistake would be visible next time.

Responsible Person: Michel Yosufov

Task ID/Title: Build profile routes and auth middleware (routes/profileRoutes.js, middleware/auth.js)

Purpose of AI Use: Sprint 1 "Resume Upload and Profile Management" feature — backend API

Chat Link or Prompt/Response: https://claude.ai/code/session_019obdut6J7ggJhg2X6z7mRR

AI-Suggested Content: Provided a `requireAuth` middleware that verifies a JWT and identifies the logged-in user, plus GET/PUT `/api/profile` (view/update profile) and POST/GET `/api/profile/resume` (upload/download resume via multer) routes.

Validation: Tested all three routes with real requests (PowerShell `Invoke-RestMethod` for profile view/update, curl for the multipart file upload). Hit a casing bug (`req.userID / decoded.userID` instead of `req.userId / decoded.userId`) that caused "User not found" even with a valid token; fixed by correcting the casing, then confirmed profile view, profile update, and resume upload all worked and persisted correctly to MongoDB Atlas.

Decision: Modified before use

Reflection: Same lesson as the Mongoose bug — a small casing mismatch between two files (auth middleware vs. route handler) silently broke the feature, and it only surfaced by testing the request end-to-end rather than just reading the code.

Responsible Person: Michel Yosufov

Yassen

AI Usage 1 — GitHub Workflow Clarification

Task ID/Title: GitHub Project Management

Purpose of AI Use: Clarify how GitHub Issues, labels, branches, and the Project Board could be used together for an Agile project.

Chat Link or Prompt/Response: ChatGPT conversation regarding GitHub workflow and project management.

AI-Suggested Content: Provided explanations and examples of how user stories could be represented as Issues and tracked through the Project Board.

Validation: Suggestions were compared with GitHub's available features and the project requirements before implementation.

Decision: Modified before use.

Reflection: AI was useful for clarifying unfamiliar GitHub features. The final repository structure, task organization, and workflow were configured based on the team's needs.

Responsible Person: Yassen Hegazy

AI Usage 2 — Team Process Brainstorming

Task ID/Title: Defining Team Processes

Purpose of AI Use: Brainstorm important topics that should be considered when establishing the team's development process.

Chat Link or Prompt/Response: ChatGPT conversation regarding Agile team processes.

AI-Suggested Content: Suggested considering areas such as branching, code review, task tracking, communication, and definitions of ready and done.

Validation: Suggestions were reviewed and selected based on their relevance to the team's actual workflow.

Decision: Modified before use.

Reflection: AI was mainly used as a brainstorming tool to ensure important process considerations were not overlooked. The final processes were selected and organized according to the team's workflow.

Responsible Person: Yassen Hegazy

AI Usage 3 — Technical Troubleshooting

Task ID/Title: Development Environment Troubleshooting

Purpose of AI Use: Assist with understanding and troubleshooting unfamiliar technologies encountered during initial project setup.

Chat Link or Prompt/Response: ChatGPT conversation regarding development tools and configuration.

AI-Suggested Content: Provided explanations and troubleshooting suggestions related to project dependencies, environment configuration, and database connectivity.

Validation: Suggested solutions were tested in the local development environment to determine whether they resolved the encountered issues.

Decision: Modified before use.

Reflection: AI was useful as a troubleshooting resource when encountering unfamiliar tools. Suggested solutions still required testing and adjustment within the actual project environment.

Responsible Person: Yassen Hegazy

AI Usage 4 — Sprint Documentation Review

Task ID/Title: Sprint 1 Documentation

Purpose of AI Use: Review the organization and clarity of Sprint 1 documentation and suggest improvements where necessary.

Chat Link or Prompt/Response: ChatGPT conversation regarding Sprint 1 documentation.

AI-Suggested Content: Suggested ways to organize sprint information and improve the clarity of several documentation sections.

Validation: Suggestions were compared against the actual work completed during Sprint 1 and edited to ensure the documentation accurately represented the team's activities.

Decision: Modified before use.

Reflection: AI was useful for reviewing the presentation and organization of information. Final content was adjusted to reflect the team's actual work and project decisions.

Responsible Person: Yassen Hegazy

JOSE

Task ID/Title: Generate Sprint 1 README and Clarify Setup Requirements

Purpose of AI Use: Documentation writing and requirements analysis

Chat Link or Prompt/Response: [\[Chat link provided / See Appendix for prompt log\]](#)

AI-Suggested Content: Provided a complete, professionally formatted README.md file tailored to Sprint 1 requirements (including problem statement, proposed solution, features, tech stack, and user stories placeholder) and clarified the requirement regarding setup/installation instructions when no codebase exists yet.

Validation: Reviewed against the SOEN 341 Sprint 1 assignment guidelines, rubric, and submission requirements.

Decision: Accepted

Reflection: The AI helped quickly draft a fully compliant README structure and confirmed that setup instructions are mandatory for Sprint 1 regardless of initial codebase state, saving time on project setup.

Responsible Person: Jose David Torres Garvin

NOOR

Task ID/Title: US-01, US-02 & US-03 — User Stories and Task Breakdown

Purpose of AI Use: Understanding user story structure and brainstorming requirements

Chat Link or Prompt/Response:

Prompt: “How should a user story be written, what should its acceptance criteria include, and can you give me a few examples for a software project?”

Response: AI explained the general structure of a user story, acceptance criteria, and tasks, with examples related to common software features.

AI-Suggested Content: General examples and ideas for structuring user stories, acceptance criteria, and tasks.

Validation: Compared the ideas with the Sprint 1 requirements, then developed and organized my own stories and tasks.

Decision: Modified before use

Reflection: The explanation helped me understand how to structure the stories and think about possible requirements. I used it mainly for brainstorming and then wrote the final acceptance criteria and tasks myself.

Responsible Person: Noor Rabie
